AMENDMENTS TO THE SPECIFICATION

2

Please amend the paragraph on page 13, lines 4-17 as follows:

Additionally, Clark, E. et al. disclosed that the treatments (such as gamma irradiation) that cause a loss of cell cycle control at the G₁/S checkpoint cause HIV-1 infected cells to lose p21 function, and undergo apoptosis (Clark E et al. (2000) "LOSS OF G(1)/S CHECKPOINT IN HUMAN IMMUNODEFICIENCY VIRUS TYPE 1-INFECTED CELLS IS ASSOCIATED WITH A LACK OF CYCLIN-DEPENDENT KINASE INHIBITOR P21/WAF1," J Virol. 74:5040-5052). Gomez, T. et al. (http://www.retroconference.org/2002/Posters/13446.pdf www.retroconference.org/2002/Posters/13446.pdf; "CYTOPLASMIC P21 WAF1/CIP1 PROTECTS U937 PROMONOCYTIC CELLS FROM HIV MEDIATED APOPTOSIS") disclose that the administration of p21antisense oligonucleotides to promonocytic cells suppressed p21 levels in the cells, and accelerated the death of the HIV-infected cells. The results are stated to indicate that p21 confers resistance to HIV-induced apoptosis in promonocytic cells, and to suggest a possible mechanism for the persistence of its infection in cells such as macrophages.
